                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 4 Application US/09847524
Facett No. 6689352
GENERAL INFORMATION:
APPLICANT: ACHEN, Marc G
TITLE OF INVENTION: GROWTH FACTOR RECEPTOR-3 AND USES THEREOF
TITLE OF INVENTION: AMETHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL
TITLE OF INVENTION: GROWTH FACTOR RECEPTOR-3 AND USES THEREOF
CURRENT APPLICATION NUMBER: US/09/847,524
CURRENT FILING DATE: 2001-05-03
NUMBER OF SEQ ID NOS: 6
SOFTWARE: PATENTIN VOIC: 2.0
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 9, Application US/09296275

Patent No. 668980

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isoid=Q8RXR2-2; Sequence=VSP_009325;
Note=May be due to a competing acceptor splice site. No experimental confirmation available;
-:- SIMILARITY: Belongs to the chloride channel (TC 1.A.11) family.
-:- SIMILARITY: Contains 2 CBS domains.
-:- CAUTION: Ref.3 sequence differs from that shown due to erroneous

```
vel monomeric monocyclic peptide, used to interfere with angiogenesis, lymphangiogenesis, is produced by cyclizing a peptide loop fragment om an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet a carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

CC neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC The condition is diabetic retinopathy, psoriasis, arthropathy, cc hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive of cormon related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are used to inage blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic or with at least one biological activity induced by VEGF. VEGF-C or D and contour inflammation, especially rheumatoid arthritis, psoriasis and continued to the contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or contour or co

The present invention describes an isolated type C lectin polypeptide (I) comprising amino acid residues 37-1393, 37-174, 175-229, 234-360, 381-507, 520-645, 667-809, 844-951, 970-1108, 1110-1243, or 1259-1393 of the protein sequence given in AAB23822. The first 2 polypeptides are capable of binding to a carbohydrate residue, and the rest of the polypeptides

are useful for producing antibodies capable of binding to these 2 polypeptides. Polynucleotide sequence encoding the polypeptides of the invention are useful in the identification and purification of their native ligands, and as molecular markers of the tissues in which they are expressed. They provide valuable sequence motifs, which can be inserted and provide hybridisation probes for searching cDNA and genomic libraries for the coding sequence of other type C lectins. Variants of type C lectins may be used therapeutically as competitive inhibitors of the biological activity of native type C lectins. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, bustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Pracnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a cample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies capecific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by cancy multiply patent did not form part of the printed specification, but was considered in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bhatia A;
                                                                                                                                                                                                                              Propionibacterium acnes immunogenic protein #24583.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Wang SS,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mitcham JL, Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; SEQ ID NO 24882; 1069pp; English.

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides aroaded by the polynucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; antibodies against polypeptides of the invention; and an isolated T cell population comprising T encompasses on the composition (comprising P. acnes polypeptides of the invention; a manner response specific for a P. acnes to polypeptide and an isolated T cell population comprising T encomposition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or configuration or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a compression or antigen-presenting cells that express the polympotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polympotides are useful for diagnosing, preventing or treating acnes to protein. The polymucleotides, polympoticides, polympoticides, or for stimulating an immune response specific for a P. acnes for or stimulating an immune response against P. acnes, or for treating acnes concleted an immune response against P. acnes, or for treating acnes conclete acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acnes and the kit is useful for performing a diagnostic assay. The present creading frame) contained within the P. acnes polympotide by an oper for treating actine and the kit is useful for performing a diagnostic assay. The present creading frame) contained within the P. acnes polymotection is useful for my and for this patent did not form part of the princed specification, but was obtained in electronic 
New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                               Example 1; SEQ ID NO 24882; 1481pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 73 AA;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a cones. The disorders include SAPHO syndrome (synovitis, acne, parenes) is also involved in infections of bone, joints and chaophthalmitis. Prevences is also involved in infections of bone, joints and chaophthalmitis. Prevence or absorce of P. acnes in a patient comprises contacting the nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the sample with a binding agent that bainds to the proteins of the invention and determining the amount of bound protein in the sample. The colypeptides may be used as antigens in the production of antibodies and determining the amount of bound protein in the sample. The colypeptides and activity of P. acnes production of antibodies and therefore treat P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The acnes polypeptides and chargenes in the production of antibodies and chargenes in the production of antibodies and therefore treat P. acnes infections. The acnes polypeptides and chargenes in the production of antibodies and chargenes in the production of antibodies and chargenes in the production, but was chargened in electronic format directly from WIPO at the printed specification, but was obtained in electronic fermat directly from WIPO at

the invention relates to an institute purjuncible condending also relates to polypeptides according a propionibacterium acnes polypeptides. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides The invention additionally encompasses expression vectors and host cells comprising a colynucleotide of the invention; an immunogenic fragments of polypeptide of the invention; an immunogenic fragment of polynucleotide of the invention; an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising P. acnes polypeptides, or polynucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the corposition of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the corposition of P. acnes in a patient. The P. acnes polypeptides, preventing or treating acnes to protein. The polynucleotides can also be used as probes or primers for contained acid hybridistation. The vaccine composition is useful for the vaccine composition is useful for the sequence contained within the P. acnes polynucleotides of the sequence trepresents a polypeptide predicted to be encoded by an ORF (open creating frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                  New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; SEQ ID NO 14472; 1481pp; English.

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to promote a capression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transforming plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or
                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, ane, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lighin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ARM35624-ARM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a compruncleotide of the invention; antibodies against polypeptides of the invention; tusion proteins comprising a polypeptide of the invention, a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising P acnes polypeptides, via this method; a vaccine composition (comprising P acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for for a detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion
                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                         aB
specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Maisonneuve JL;

       polypeptides are useful for diagnosing, presenting veries under the useful for diagnosing, preventing of treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
T cell populations or antigen-presenting cells that express the

The sequences are used in diagnosis and treatment of malignant tumour, embryonic developmental abnormality and autoimmune disease and for studying human antisenescence. This sequence represents human protein phosphatase 13.31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; protein phosphatase 13.31; enzyme; malignant tumour; cancer; embryonic developmental abnormality; autoimmune disease; antisenescence; gynaecological; cytostatic; immunosuppressant; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human protein phosphatase 13.31 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, autoimmune disease and embryonic development abnormality.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed attracts the sectore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypopide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders convolving aberrant protein expression or biological activity. The capposible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WHDO at the printed specification, but was obtained in the way in the printed specification, but was obtained in the printed produces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

AAPB1714 to AAPB1740 encode the human proteases and protease inhibitors

(PPIMS) given in AAB74668 to AAB74694. The PPIMS can have activities such

as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid;
immunostimulant; immunodeficiency virus (HIV); antidiabetic; antithyroid;
communostimulant; immunodeficiency virus (HIV); antidatherosphressive;
compined, antipgout; thyromimetic; cytostatic; antiatheroscherial;
compicide; protozoacide; antiarteriosclerotic; antiatherosclerotic;
virucide; protozoacide; antiarteriosclerotic; antiatherosclerotic;
virucide; antipgoriatic; and hepatotrophic. PPIM polymucleotide and
cof autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome,
combined immunodeficiency disease (SCID), Chediak-Higashi
syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis,
crohn's disease, diabetes mellitus, Good pasture's syndrome, gout,
crohn's disease, Hashimoto's thyroiditis, Sjogren's syndrome, gout,
crohn's diseases, Hashimoto's thyroiditis, Sjogren's syndrome, gout,
crohn's diseases, Hashimoto's thyroiditis, protozoal, and helminthic
crome, viral, bacterial, fungal, parasitic, protozoal, and helminthic
cinfections and cell proliferative disorder such as arteriosclerosis,
atherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM
coplymucleotide sequences can be used in somatic or germling
chybridisation probse useful in mapping the naturally occurring genomic
sequences and in molecular biology techniques

New protease (inhibitors) useful for diagnosis and treatment of autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome, Cushing's disease, Addison's disease and cell proliferative

Claim 1; Page 114-115; 134pp; English.

disorders such as cancer.

```
AADD05579-AADD05658 represent cDNAs corresponding to 28 human secreted protein genes and AAED1770-AAED1849 represent the proteins they encode. AAED1860 represent human secreted protein fragments or variants. The genes and their secreted proteins are secul for preventing, variants or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative
                                                                 ö
                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy; neurological disorder; Alzheimer's disease; Parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; angiogenic disorder; kidney disorder; gastrointestinal disorder; pregnancy-related disorder; gene therapy; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; chromosome 17; binding partner identification.

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders anchieve, The protein is useful for treating and diagnosing disorders disease, ulcerative colitis, immune disorders (e.g. acquired immunodeficiency syndrome, AlDS), endocrine disorders (e.g. diabetes), hammatopoletic disorders, neural disorders (e.g. Alzheimer's, hammatopoletic disorders, neural disorders (e.g. Alzheimer's, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention Sequence 802 AA; 888888888888888888888888

Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databases.

I FUNCTION: Growth factor active in anglogenesis, lymphangiogenesis and endothelial cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood vessels. May function in the formation of the venous and lymphatic vessels. May function in the formation of the wenous and lymphatic of differentiated lymphatic endothelium in adults. Binds and activates WEGFR-3 (FL4) receptor (By similarity).

--- SUBGNIT: Homodimer; non-covalent and antiparallel (By similarity).

--- SUBGLILUAR LOCATION: Secreted (By similarity).

--- FPM: Undergoes a complex proceedlytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-2; weggre-D is composed mostly of two VEGF homology domains (VHDs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. Vascular endothelial growth factor D precursor (VEGF-D) (c-fos induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kirkin V., Mazitschek R., Krishnan J., Steffen A., Waltenberger J., Pepper M.S., Giannis A., Sleeman J.P.;
"Characterization of indolinones which preferentially inhibit VEGF-C-and VEGF-D-induced activation of VEGFR-3 rather than VEGFR-2.";
Eur. J. Biochem. 268:5530-5540(2001).
--- SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
HSSP; P01127; 1PDG.

A Diol. Chem. 276:19166-19171(2001)

- I- FUNCTION: Growth factor active in angiogenesis, lymphangiogenesis

and endothelial cell growth, stimulating their proliferation and
migration and also has effects on the permeability of blood
vessels. May function in the formation of the venous and lymphatic
vacular systems during embryogenesis, and also in the maintenance
of differentiated lymphatic endothelium in adults. Binds and
activates VEGFR-3 [Fl4) receptor.

- SUBURILUAR LOCATION: Secreted.

- ITSGUE SPECIFICITY: Highly expressed in fetal and adult lung.

- ISGUELLUAR LOCATION: Secreted.

- ITSGUE SPECIFICITY: Highly expressed in a dynamic pattern in several
body structures and organs of the embryo such as limb buds,
acoustic ganglion, teeth, heart, anterior pituitary as well as
lung and kidney mesenchyme, liver, derma, and periosteum of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vertebral column.

INDUCTION: By the transcription factor c-fos.

PUN: Undergoes a complex proteolytic maturation which generates a PTM: Undergoes a complex proteolytic maturation which generates a Variety of processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed vegFR-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity).

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=98288130; PubMed=9622618; DOI=10.1016/S0925-4773(98)00049-5; Avantaggiato V., Orlandini M., Acampora D., Oliviero S., Simeone A.; Embryonic expression pattern of the murine figf gene, a growth factor belonging to platelet-derived growth factor/vascular endothelial growth factor family.";
